

IMAGE COPY (SCHID=2)

FREQUENCY

This schedule runs every Sunday evening creating dual image copies of most production databases (one is on-site and the other is for disaster recovery). However, it does not include the reference table processing or the initialization for on-line BTQs. It used to run at the end of each night but no longer runs due to time constraints. This schedule is still available on a request basis any time a complete set of images would be desirable. There is a dummy job - CEPIMEN2 - which indicates that the CEPIMAGE schedule is complete. CEPIMEN2 is triggered by CEPIMAGE and is dependent upon the last job in each leg of the schedule. Please review the flow diagram for the complete list of jobs in this schedule.
